That would be the PCR tests, which is a molecular test, that's also known as a nucleic acid test. It picks up the pieces of genetic material. In this case, it's RNA for the COVID virus. It's very accurate and very precise, and sensitive.

00 2

First and foremost, read the instructions, read the instructions and read the instructions. Fortunately, they usually come with instructions as well as like a diagram or pictures to show you exactly what to do, the timing of it, as well as the results, how to interpret the results. Pay attention to those things and have a timer on your phone or kitchen timer, and you'll be fine.

00

No, they cannot. Once they're used, they're done.

00

Well, let me answer it this way. If you're fully vaccinated or have had COVID-19 in the last 90 days you don't have to be tested. But if you're symptomatic, you would but you don't have to be. What is recommended would be to wear a mask wherever you go and to ask your employer when you can return. Most likely j
