

Tuberculosis is developing resistance to almost every drug available, which has led to fears of an epidemic. In South Africa, health authorities have locked up patients diagnosed with XDR TB in an effort to stop the disease from spreading. How should the issue be resolved? Can countries balance their need to protect the public from a killer disease with the rights of the individual patients? *Survival: The Deadly Combination* examines the impact that extremely drug resistant (XDR) TB is having on people and societies. It deals with some controversial approaches, such as quarantine, to dealing with the illness.

March 24 is World Tuberculosis Day. This film was selected to raise public awareness of tuberculosis and the efforts made to prevent and treat the disease.

Survival, March 27

Netflix, ACB 240
